| Description | A sample of fixed cells labeled 74 Lead Hom (BB) (KromaTiD Sample ID S005286) was received at KromaTiD on 08-26-21.<br>The fixed cells were washed twice with fixative (prepared fresh day-of-use) and the O.D. was adjusted to 0.0250. Drops of the final cell suspension were placed on clean slides and aged for 60 minutes at 90°C. Slides were digested in a pancreatin solution with Isoton II diluent. The enzymatic reaction was then stopped by rinsing with FBS, followed by application of a stain solution (3:1 Wright/Gurr buffer) which was poured on the slides so that it covered the entire surface. After staining for up to 1 minute, slides were washed with de-ionized water for 1-5 seconds and air dried. The mounting medium Permount was applied to the slides, a coverslip was placed on the slide and the slides were scanned on the microscope. |

# **TEST DESCRIPTION:**

G-banding with trypsin treatment and Giemsa stain (GTG-banding) is used in cytogenetics to produce a visible karyotype by staining metaphase chromosomes. This technique allows each chromosome to be distinguished by its characteristic banding pattern. G-banding is useful in assessing structural abnormalities in individual chromosomes, as well as extra or missing chromosomes within a cell. Industry-standard protocols for scoring and describing results were used (ISCN 2016: An International System for Human Cytogenomic Nomenclature).

KromaliD

#### V. **RESULTS**

| Cells Counted       | 20 | Total Karyograms        | 2   |
|---------------------|----|-------------------------|-----|
| Cells Analyzed      | 20 | Average Band Resolution | 350 |
| Image File Location |    | Jax Gbanding_S005286    |     |

#### 5.1 Chromosome Count per 20 Metaphases

Of the 20 cells counted, 17 contained 46 chromosomes (85%). *Cells containing greater than* 57 *chromosomes are recorded as polyploid*. The polyploid frequency was 0%, based on the metaphases counted.

#### 5.2 CHROMOSOME ABERRATION DATA

The chromosome aberration data via G-band for the 20 metaphases examined is summarized in attached case report cell list. 0 chromosome aberrations were found in the 20 cells analyzed with 0% of the cells aberrant.

\*Note: Cells with an euploidy gain/loss were found to be non-clonal, and therefore not included in the aberration data below.

| Tech<br>Summary |           | Additional Comments               |  |  |

#### 5.3. INTERPRETATION/ SIGNIFICANCE:

G-banded chromosome analysis of metaphase cells designated as 74 Lead Hom (BB) (KromaTiD Sample ID S005286) show a normal male karyotype 46,XY[20].

The other abnormalities/aberrations detected were non-clonal, and were designated as low level mosaicism or random gain/loss.

**Limitations:** This assay allows for microscopic visualization of numerical and structural chromosome abnormalities. The size of structural abnormality that can be detected is >3-10Mb, dependent upon the G-band resolution obtained from this specimen. For the purposes of this report, band level is defined as the number of G-bands per haploid genome. Detection of heterogeneity of clonal cell populations in this specimen is limited by the number of metaphase cells analyzed, documented above as "number of cells counted". Results are for Research Use Only, and should not be used for clinical purposes.
