Watkins Star Line B (WSB) was derived from wild mice trapped in Eastern Shore, Maryland. WSB is characterized by a distinct and consistent white head blaze, variable ventral spotting and a slight coat dilution on the agouti background. The variation in pigment is the result of the spontaneous mutation blaze ($Kit^l$).

The Jackson Laboratory's Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain's phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
