Overview

Also Known As: PAHARI/EiJ

Mus pahari is a species of Mus discovered in 1916 by O. Thomas in the mountainous Sikkim region of India. Mus pahari has a functional Xpr1 gene and is susceptible to the gammaretrovirus, xenotropic murine leukemia virus-related virus (XMRV). This wild derived mouse strain is genetically distinct from common laboratory mice for a number of complex phenotypic characteristics and is a valuable tool for sequence comparison, evolution and systematics research.

Important note: These mice are characterized by fragile skin. Tail-skin will come off if the mouse is handled by the tail. To prevent this, these mice are moved from cage-to-cage using plastic cups.

*Mus pahari* is a species of *Mus* discovered in 1916 by O. Thomas in the mountainous Sikkim region of India. *Mus pahari* is also known as the Indochinese Shrewlike mouse, Sikkim mouse and Gairdiner’s Shrewmouse. *Mus pahari* is distantly related to laboratory mice and does not breed with laboratory mice. Unlike common laboratory mice, which lack a functional *Xpr1* gene and are resistant to the gammaretrovirus, xenotropic murine leukemia virus-related virus (XMRV), *Mus pahari* is susceptible to XMRV. XMRV has been identified in patients with prostate cancer and in patients with chronic fatigue syndrome. These mice are characterized by fragile skin; please note: tail-skin will come off if the mouse is handled by the tail. Mice are moved from cage-to-cage using plastic cups. This wild derived mouse strain is genetically distinct from common laboratory mice for a number of complex phenotypic characteristics and is a valuable tool for sequence comparison, evolution and systematics research.

Breeding Considerations
Comments: This strain must be handled very carefully since skin tears easily. It is best to transfer these mice from cage to cage using a transfer cup.

The Jackson Laboratory's Genotype Promise

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain's phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
