JF1/Ms (Japanese Fancy Mouse) was derived from a fancy mouse stock, and has been identified as belonging to species M. m. molossinus. JF1 is homozygous for the piebald allele (Ednrb). Wild-derived mice are genetically distinct from common laboratory mice for a number of complex phenotypic characteristics and are valuable tools for genetic mapping, evolution and systematic research.

Detailed Description

JF1/Ms (Japanese Fancy Mouse) was derived from a mouse stock purchased from a market in Denmark, and has been identified as belonging to species *M. m. molossinus*. JF1 carries the piebald allele, a retroposon-like insertion in intron 1 of the endothelin receptor type B (*Ednrb*) gene, which results in a white coat with black spots and black eyes. The white areas of the coat are lacking in neural crest-derived melanocytes. In addition to alterations in coat color, JF1 mice exhibit a decreased amount of enteric innervation and neuronal density predominantly in the distal colon, but do not exhibit any of the megacolon symptoms often associated with mutations in *Ednrb*. Wild-derived mice are genetically distinct from common laboratory mice for a number of complex phenotypic characteristics and are valuable tools for genetic mapping, evolution and systematics research.

In 2019-2020, researchers at The Jackson Laboratory discovered this inbred strain contains the *Trem2<sup>S148E</sup>* allele - a naturally occurring variant at position 48351151-48351152 on Chr 17 (*rs108080490* and *rs107649577*; Ensembl GRCm38.p6). This TC to GA transition results in a serine to glutamic acid substitution at amino acid 148 (S148E).

PAYMENT TERMS AND CONDITIONS

Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

THE JACKSON LABORATORY'S GENOTYPE PROMISE

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain's phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project. We do not guarantee breeding performance and therefore suggest that investigators order more than one breeding pair to avoid delays in their research.
