Overview

Also Known As: short face

The Pfas<sup>Sofa</sup> semidominant allelic series on the C57BL/6J background all cause a short snout and related craniofacial defects, along with variably penetrant phenotypes of white belly spot and tail tip.

**Details**

**Detailed Description**

The short face mutation is lethal in homozygotes and has varying penetrance in heterozygous carriers, which can be phenotypically undetectable or can display a short, upturned nose, domed skull, and wide-set eyes. Heterozygotes often have a white belly spot or white tail tip but these phenotypes have incomplete penetrance.

Breeding Considerations
Although dominant, the Sofa mutation has varied penetrance. This strain is maintained by intercrossing phenotypic heterozygotes with unaffected siblings presumed to be +/-, but potentially low penetrance carriers.

The Jackson Laboratory’s Genotype Promise

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
