The Jackson Laboratory cannot guarantee that cryorecovery of strains from the discontinued NIH-funded Neuroscience Mutagenesis Facility (NMF) will be successful or that the anticipated phenotype or genotype will be obtained. The cryorecovery fee for this effort will not be refunded or prorated if the recovery is unsuccessful or is in any way unsatisfactory. Genotyping will be the responsibility of the Purchaser.

Details

Detailed Description

The hind limbs of these mutants are kept close together, and show intense, intermittent spasms; body tremor during movement and rest also occurs intermittently, as does head tossing behavior. When lifting mutants into the air by their tail, the

hind limbs are drawn toward their body. Front limbs appear to be affected in some animals, i.e. are turned medially with apparent plantar flexion; these mutants move around slowly, are fragile and might not live to full maturity. The onset of this phenotype is at approximately 3 weeks of age (average 3.4+/-0.5 weeks of age; n=32). Standard pathology work-up on three mutants (18 - 26 days of age) revealed hypercellular Islets of Langerhans in the pancreas and wasting in the liver of one mutant; an atrophic thymus was noted in another mutant. No other abnormalities have been observed.

Mutants do not breed well, and a colony has to be maintained through ovarian transplants.

PAYMENT TERMS AND CONDITIONS

Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

THE JACKSON LABORATORY'S GENOTYPE PROMISE

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. **Therefore, we cannot guarantee a strain's phenotype will meet all expectations.** To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project. We do not guarantee [breeding performance](#) and therefore suggest that investigators order more than one breeding pair to avoid delays in their research.
