Overview

Also Known As: Nur77<sup>+</sup>, NGFI-B-

Adrenal expression of Nr4a2 is increased threefold following LPS challenge in homozygous mice of this strain. Mutant mice may be useful in studies of anti-psychotic drug/neuroleptic therapies and other neurological studies.

### Details

#### Detailed Description

Mice homozygous for this targeted mutation are viable and fertile, with no gross anatomical or behavioral abnormalities. No transcript is detectable in thymus. Following acute neuroleptic administration with dopamine D2 receptor antagonists (haloperidol and/or raclopride), homozygous mice exhibit reduced catalepsy and disrupted neuropeptide responses in the brain. In homozygotes, adrenal expression of Nr4a2 (also called Nurr1) is increased threefold following LPS challenge. Mutant mice may be useful in studies of antipsychotic drug/neuroleptic therapies, schizophrenia, neurobiology, nuclear receptor family transcription pathways, adrenal gland, and steroidogenesis.

Invoices and account balances in arrears of stated terms may result in the Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

The Jackson Laboratory's Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
