Overview

Also Known As: Pendred syndrome model

Mice homozygous for the Slc26a4<sup>pdsm</sup> spontaneous mutation have multiple inner ear defects and display head bobbing, circling, and occasional head tilt.
Mice homozygous for the \textit{pdsm} mutation display head bobbing, circling, and occasional head tilt, evident by 3 weeks of age. The inner ear defects include diminished or absent otoconia, hair cells and spiral ganglion cells, malformed tectorial membrane, a reduction in the number of cochlear turns, degeneration of the organ of Corti, and displacement of Reissner's membrane resulting in enlarged scala media. Serum chemistry and histology failed to detect any signs of hypothyroidism.

The Jackson Laboratory's Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain's phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
