Overview

Also Known As: TAU KO

Hippocampal neurons (primary culture) from embryos that are homozygous for the microtubule-associated protein tau (Mapt) knock-out mutation, TAU^-/-, have delayed axonal extension and shorter total dendritic length and abnormal mitochondrial placement and movement. This mutant mouse strain may be useful in studies of neuronal development, axonogenesis, and organelle movement.

Detailed Description

Mice that are homozygous for the targeted mutation are viable, fertile, normal in size and do not display any gross physical or behavioral abnormalities. No gene product (mRNA or protein) is detected by RT-PCR analysis of total brain RNA, Western blot analysis of total brain homogenates or immunostraining of coronal brain sections. Hippocampal neurons from homozygous embryos, in primary culture, have delayed axonal extension and shorter total dendritic length when compared to wildtype controls. Mitochondria in the primary culture cells cluster at the distal end of axons. The frequency and velocity of mitochondrial anterograde movements is increased.

This mutant mouse strain may be useful in studies of neuronal development, axonogenesis, and organelle movement.

The Jackson Laboratory’s Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
