lymph node are unchanged. Truncated product (mRNA) is detected by Northern blot analysis of splenocytes isolated from homozygous animals. A secreted protein without known physiologic consequences is detected in serum from homozygous animals, but no surface protein is detected on cells of hematopoietic lineage, including T cells, B cells, and myeloid cells. This strain may be useful for studies of immune responses.

Details

Detailed Description

Gene targeting was used to remove a transmembrane domain from the targeted protein. Homozygotes exhibit a partial peripheral B cell development block at the first transitional stage (T1), although total T or B cell numbers in the spleen and lymph node are unchanged. Truncated product (mRNA) is detected by Northern blot analysis of splenocytes isolated from homozygous animals. A secreted protein without known physiologic consequences is detected in serum from homozygous animals, but no surface protein is detected on cells of hematopoietic lineage, including T cells, B cells, and myeloid cells. Mice that are heterozygous for the targeted mutation are viable, fertile, normal in size and do not display any gross physical or behavioral abnormalities; homozygotes are not fertile. This strain may be useful in studies of immune responses.

Breeding Considerations

When maintained as a live colony, heterozygotes may be bred. Homozygous males and females are not fertile.

Additional Breeding and Husbandry Support

Citation
When using the B6.129P2(C)-*Ptprj*$^{tm1.2Weis}$/J mouse strain in a publication, please cite the originating article(s) and include JAX stock #008289 in your Materials and Methods section.

Animal Health Reports
Facility Barrier Level Descriptions

Production of mice from cryopreserved embryos or sperm occurs in a maximum barrier room, G200

PAYMENT TERMS AND CONDITIONS

Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

THE JACKSON LABORATORY'S GENOTYPE PROMISE

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. **Therefore, we cannot guarantee a strain's phenotype will meet all expectations.** To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project. We do not guarantee breeding performance and therefore suggest that investigators order more than one breeding pair to avoid delays in their research.
