Overview

Mice heterozygous for this semi-dominant spontaneous mutation of the calcium channel, voltage-dependent, P/Q type, alpha 1A subunit gene have a shaky gait, but do not exhibit dyskinesia or absence seizures. The Tottering-5J mutation causes a shift in voltage activation and inactivation to lower voltages. This strain may be useful for studies of epilepsy and voltage-dependent calcium channels.

Detailed Description

Mice heterozygous for the semi-dominant Tottering 5 Jackson mutation exhibit a shaky gait with hind limbs splayed laterally from the body in contrast to the other tottering mutants. Also, unlike tottering mice, Tg-5J heterozygotes do not exhibit dyskinesia or absence seizures. Axonal swelling is observed in Purkinje cells from homozygotes as well as a decrease in branching. The Tg-5J mutation causes a shift in voltage activation and inactivation to lower voltages. This strain may be useful for studies of epilepsy and voltage-dependent calcium channels.

The C57BL/10J background appears to be embryonic lethal as no homozygotes are produced in heterozygote x heterozygote matings. On a mixed BALB/cByJ and C57BL/10J background some homozygotes are produced, but die before 6 weeks of age.

Breeding Considerations
When maintaining a live colony, these mice are bred as heterozygotes. On the C57BL/10J background, homozygous mice die before birth.

Payment Terms and Conditions
Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

The Jackson Laboratory’s Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
