Details

Detailed Description
Prdm1-Cre (Blimp1-Cre) transgenic mice express Cre recombinase under the control of the mouse Prdm1 (PR domain containing 1, with ZNF domain; Blimp1) promoter. Cre-mediated recombination is detected in 55-76% of primordial germ cells when this strain is crossed with Gt(ROSA)26-GFP reporter mice. Expression is also seen in plasma cells. These mice may be useful for generating tissue-specific targeted mutants for studies of development and germ cell fate.

The Jackson Laboratory’s Genotype Promise

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
