These floxed mutant mice possess loxP sites flanking exon 4 of the transforming growth factor, beta receptor II (Tgfbr2) (commonly referred to as TβRII) targeted gene. This strain may be useful for studying the cellular and mechanical role of TGF-β in regulating development, hematopoiesis, wound healing, and immune function.

**Detailed Description**

These TβRII floxed mutant mice possess loxP sites flanking exon 4 of the targeted gene. Mice that are homozygous for this allele are viable, fertile, normal in size and do not display any gross physical or behavioral abnormalities. When these mutant mice are bred to mice that express Cre recombinase, resulting offspring will have exon 4 deleted in cre-expressing tissues. This strain may be useful for studying the cellular and mechanical role of TGF-β in regulating development, hematopoiesis, wound healing, and immune function.

For example, when crossed to a strain expressing Cre recombinase in the neural tube, midbrain and dorsal spinal cord (see Stock No. 007807), this mutant mouse strain may be useful in studies of DiGeorge syndrome.

For example, when crossed to a strain expressing interferon inducible Cre recombinase (see Stock No. 003556), this mutant mouse strain may be useful in studies of autoimmune inflammation.

**Payment Terms and Conditions**

Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

**The Jackson Laboratory’s Genotype Promise**

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized.
and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
