This spontaneous mutation in *Wnt7a* provides a model for Fuhrmann syndrome, with malformed, shortened forelimbs, missing digits, and sterility.
Mice homozygous for the postaxial hemimelia Jackson mutation have malformed, shortened forelimbs and missing or shortened digits of the front feet. A few have missing digits from the hind feet. Both males and females are sterile although ovaries from homozygotes can be successfully used in ovarian transplantation for breeding and sperm from homozygotes can be used successfully for *in vitro* fertilization, although it appears to have reduced motility.

Breeding Considerations
Hosts of homozygous ovarian transplants are bred to C57BL/6J males or unaffected male siblings of the donor and the resulting obligate heterozygotes are intercrossed to generate homozygotes.

Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

The Jackson Laboratory's Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain's phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
