Overview

Also Known As: C57BL/6 albino;hairless

These B6.albino;hairless mice are a C57BL/6-congenic line harboring both the albino allele (Tyr<sup>−2J</sup>) and hairless allele (Hr<sup>hr</sup>). The lack of skin pigmentation and hair allow studying ultraviolet light-induced carcinogenesis.

**Detailed Description**

These B6-albino:hairless mice are a C57BL/6-congenic line harboring both the albino allele (Tyr<sup>c-2J</sup>) and hairless allele (Hr<sup>hr</sup>). The lack of skin pigmentation and hair allow studying ultraviolet light-induced carcinogenesis.

C57BL/6-J-congenic albino mice are described and available from The Jackson Laboratory as Stock No. 000058.

C57BL/6-J-congenic hairless mice are described and available from The Jackson Laboratory as Stock No. 001737. Females homozygous for the hairless mutation may become pregnant, but have poor lactation and fail to keep their pups warm;
resulting in death of their litters.

In an attempt to offer alleles on well-characterized or multiple genetic backgrounds, alleles are frequently moved to a genetic background different from that on which an allele was first characterized. It should be noted that the phenotype of the C57BL/6-congenic albino, hairless mice could vary from that originally described for the individual mutant lines. We will modify the strain description if necessary as published results become available.

Breeding Considerations
Note that C57BL/6-congenic hairless mice (Stock No. 001737) are born with hair, but the hair is lost by approximately ten days of age. Females homozygous for the hairless mutation may become pregnant, but have poor lactation and fail to keep their pups warm; resulting in death of their litters.

To maintain the live B6.albino/hairless colony (Stock No. 017840), females homozygous for the albino mutation and heterozygous for the hairless mutation are bred with males homozygous for the albino mutation and homozygous for the hairless mutation. That is, albino females with hair are bred with albino hairless males.

**The Jackson Laboratory’s Genotype Promise**

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
