Detailed Description

Mice hemizygous for the MRP8-Cre-ires/GFP transgene are viable and fertile, with the human S100 calcium binding protein A8 (calgranulin A) (MRP8 or S100A8) promoter directing bicistronic Cre and EGFP protein expression to granulocytes and granulocyte/macrophage progenitors (GMPs). EGFP fluorescence and cre expression is evident in hemizygotes in 20% of granulocyte/macrophage progenitors (GMPs) and 100% of granulocytes during myeloid differentiation. When bred with mice containing a loxp-flanked sequence of interest, the resulting offspring can have Cre-mediated recombination of the flanked sequence in these cells.

Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

The Jackson Laboratory's Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain’s phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
