Details

Detailed Description

Fgf21 knock-out mice lack exons 1-3 of the fibroblast growth factor 21 (*Fgf21*) gene. FGF21 is an endocrine hormone, expressed in liver and pancreas, which stimulates glucose uptake in adipocytes. FGF21 induction in liver by peroxisome proliferator-activated receptor α (PPAR α) during fasting induces fatty acid oxidation ketogenesis in liver. Homozygotes are viable and fertile. Livers from these mice have decreased beta-oxidation, ketogenesis, and gluconeogenesis under fasted conditions.

Of note, the floxed version of this allele is available as Stock No. [022361](#).

PAYMENT TERMS AND CONDITIONS

Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

THE JACKSON LABORATORY'S GENOTYPE PROMISE

The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. **Therefore, we cannot guarantee a strain's phenotype will meet all expectations.** To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project. We do not guarantee [breeding performance](#) and therefore suggest that investigators order more than one breeding pair to avoid delays in their research.
