Also Known As: NZB/W

Mice of this hybrid cross develop an autoimmune disease resembling human systemic lupus erythematosus. Autoimmunity is characterized by high levels of antinuclear antibodies, hemolytic anemia, proteinuria, and progressive immune complex glomerulonephritis. NZBWF1/J mice have been used as a model for autoimmune disease since the early 1960s elucidating not only
the complex immunobiological responses and mechanisms but also the genetic basis for the complex multifactorial disease.

Our preclinical efficacy testing services offer scientific expertise and an array of target-based and phenotype-based outcome measures, both in vivo and at endpoint, for flexible study designs and assay development in mouse models of Lupus. See our full service platform.

**Details**

Systemic lupus erythematosus (SLE), is a chronic, inflammatory, autoimmune disease of unknown origin. There is strong evidence supporting the role of genetics in determining susceptibility and resistance to the disease. NZBWF1/J develop an autoimmune disease resembling human systemic lupus erythematosus. Autoimmunity is characterized by high levels of antinuclear antibodies, hemolytic anemia, proteinuria, and progressive immune complex glomerulonephritis. The incidence and severity of symptoms is more pronounced in females. The average lifespan for NZBWF1 is 245 days for females and 406 days for males. NZBWF1/J mice have been used as a model for autoimmune disease since the early 1960s elucidating not only the complex immunobiological responses and mechanisms but also the genetic basis for the complex multifactorial disease.

Payment Terms and Conditions
Terms are granted by individual review and stated on the customer invoice(s) and account statement. These transactions are payable in U.S. currency within the granted terms. Payment for services, products, shipping containers, and shipping costs that are rendered are expected within the payment terms indicated on the invoice or stated by contract. Invoices and account balances in arrears of stated terms may result in The Jackson Laboratory pursuing collection activities including but not limited to outside agencies and court filings.

The Jackson Laboratory's Genotype Promise
The Jackson Laboratory has rigorous genetic quality control and mutant gene genotyping programs to ensure the genetic background of JAX® Mice strains as well as the genotypes of strains with identified molecular mutations. JAX® Mice strains are only made available to researchers after meeting our standards. However, the phenotype of each strain may not be fully characterized and/or captured in the strain data sheets. Therefore, we cannot guarantee a strain's phenotype will meet all expectations. To ensure that JAX® Mice will meet the needs of individual research projects or when requesting a strain that is new to your research, we suggest ordering and performing tests on a small number of mice to determine suitability for your particular project.
